

Week 11 Worksheet

Scattering

Jacob Erlichman

November 7, 2025

Exercise 1. Spin-spin Interaction. Consider two spin-1/2 particles that interact in a potential of the form

$$V(r) = V_o(r) + V_s(r)\boldsymbol{\sigma}^{(1)} \cdot \boldsymbol{\sigma}^{(2)}.$$

Suppose that both the orbital and spin interactions are short range in the interparticle separation r (i.e. vanish faster than $1/r$ as $r \rightarrow \infty$).

- The first Born approximation for the scattering amplitude is given by

$$f(\mathbf{k}, \mathbf{k}') = -\frac{4\pi^2 m}{\hbar^2} \langle \mathbf{k}' | V | \mathbf{k} \rangle.$$

Use a Fourier transform to express the scattering amplitude in terms of

$$\int e^{-i(\mathbf{k}-\mathbf{k}') \cdot \mathbf{r}_0} V_o(r_0) d^3 r_0,$$

and a similar expression for $V_s(r_0)$.

Hints: Don't forget to account for the initial and final spins! Note that

$$\langle \mathbf{x} | \mathbf{k} \rangle = \frac{e^{i\mathbf{k} \cdot \mathbf{x}}}{(2\pi)^{3/2}}.$$

- Show that the eigenvalues of $\boldsymbol{\sigma}^{(1)} \cdot \boldsymbol{\sigma}^{(2)}$ are the singlet and triplet states, with eigenvalues -3 and 1 , respectively.

Hint: This is easiest to do if you write $\boldsymbol{\sigma}^{(1)} \cdot \boldsymbol{\sigma}^{(2)}$ in terms of operators for which the singlet and triplet are eigenstates.

- If the incoming particles have parallel spins, is a spin flip possible? Why or why not? Explain why the scattering is elastic or inelastic in this case, and then calculate the scattering amplitude.
- Calculate the scattering amplitude for incident particles with opposite spins. You should be able to split it into two channels: an elastic one and an inelastic one (why?).
