## Week 5 Worksheet More Perturbation Theory

## Jacob Erlikhman

September 23, 2025

Exercise 1. Griffiths 7.54. Last week, you derived the first order correction to the expectation value of an observable A in the n<sup>th</sup> energy eigenstate of a system perturbed by  $H^1$ . You found

$$\langle A \rangle^1 = 2 \operatorname{Re} \sum_{m \neq n} \frac{\left\langle n^0 | A | m^0 \right\rangle \left\langle m^0 | H^1 | n^0 \right\rangle}{E_n^0 - E_m^0}.$$

Suppose we have a particle of charge q in a weak electric field  $\mathbf{E} = E_{\rm ext}\hat{x}$ , so that  $H^1 = -qE_{\rm ext}x$ . This induces a dipole moment  $p_e = qx$  in the "atom." The expectation value of  $p_e$  is proportional to the applied field, and the proportionality factor is called the **polarizability**,  $\alpha$ . Show that

$$\alpha = -2q^{2} \sum_{m \neq n} \frac{|\langle n^{0} | x | m^{0} \rangle|^{2}}{E_{n}^{0} - E_{m}^{0}}.$$

Find  $\alpha$  for the ground state of a 1-D harmonic oscillator, and compare the classical answer.

*Hint:* Recall that x can be written in terms of creation and annihilation operators. Given

$$H^0 = \frac{1}{2m} \left[ p^2 + (m\omega x)^2 \right],$$

you can derive what a and  $a^{\dagger}$  should be in terms of x and p by using the sum of squares formula. To get the "usual" form, rescale each of them by  $a \to \frac{1}{\sqrt{\hbar}\omega}a$  (so that the hamiltonian can be written  $\frac{H^0}{\hbar\omega} = a^{\dagger}a + 1/2$ ).

Exercise 2. Griffiths 7.45. Stark Effect in Hydrogen. When an atom is placed in a uniform electric field  $\mathbf{E}_{\text{ext}}$ , the energy levels are shifted. This is known as the **Stark effect**. You'll analyze the Stark effect for the n=1 and n=2 states of hydrogen. Suppose  $\mathbf{E}_{\text{ext}} = E_{\text{ext}} \hat{z}$ , so that

$$H^1 = eE_{\rm ext}r\cos\theta$$

is the perturbation of the hamiltonian for the electron, where  $H^0 = \frac{p^2}{2m} - \frac{e^2}{r}$ .

- a) Show that the ground state energy is unchanged at first order.
- b) How much degeneracy does the first excited state have? List the degenerate states.

Worksheet 5 2

c) Determine the first-order corrections to the energy. Into how many levels does  $E_2$  split?

*Hint*: All  $W_{ij}$  are 0 except for two, and you can avoid doing all of the zero integrals in this problem by using symmetry and selection rules. You'll need the following

$$\psi_{210} = \frac{1}{2\sqrt{6}} a^{-3/2} \frac{r}{a} e^{-r/2a} \sqrt{\frac{3}{4\pi}} \cos \theta$$

$$\psi_{200} = \frac{1}{\sqrt{2}} a^{-3/2} \left( 1 - \frac{r}{2a} \right) e^{-r/2a} \frac{1}{2\sqrt{\pi}}.$$

d) What are the "good" wavefunctions for (b)? Find the expectation value of the electric dipole moment in each of these states.
